Abstract:

The under ground metro of Cairo has its important role in the life of cities and its zones .
It has various effects on city components and human activities specially in big cities like
greater Cairo which involve a lot of informal settlement and also many problems .
Since 1987 the metro play its important role in solving traffic problems , and it was
considered that metro has a lot of positive effects on urban agglomeration specially in
surrounding zones , but after 17 years it was found that a lot of negative effects has
occurred in urban agglomeration because of metro specially in informal settlements in
fringes.

This paper aims to count and clarify these negative effects as a result of the penetration of
metro line through these areas .

The paper also trying to find most appropriate solutions to ignore or reduce the influences
of these effects through a group of tools to control the urban mass of informal settlements
specially these once attached directly to the metro line path.
