

- 1- The following are results of test cubes of concrete in construction site in Cairo to produce concrete of characteristic strength equal to  $250 \text{ kg/cm}^2$  at the age of 28 days. Find the actual  $F_c$  of the produced concrete. Classify the quality of concrete production, and the efficiency of the testing laboratory. [ ] [ ] [ ] [ ]  
 Find the actual % of defective samples. [ ]
- 2- For the data in Questions 1: Draw the quality control charts for individual reading, moving average, and moving range.

CAST	STRENGTH, $\text{kg/cm}^2$			CAST	STRENGTH, $\text{kg/cm}^2$		
أبريل-27	334.9	334.9	331.2	مايو-17	384.3	360.5	400.8

- 3- Construction Site in Alexandria produces concrete for construction site [ ]  
 The average of the test cubes at the age of 28 days is  $393 \text{ kg/cm}^2$ , and the standard deviation equals to  $80 \text{ kg/cm}^2$ . Find the actual  $F_c$  and compare with the site in Question 1. Comment on the comparison results.
