

**Course Title**  
**"NONLINEAR ANALYSIS OF REINFORCED CONCRETE STRUCTURES"**

**Table of Contents**

- 1- Introduction
- 2- Purpose of the nonlinear analysis
- 3- Definitions (Tension stiffening- compression softening – secant and tangent elastic modulus.....)
- 4- Factors affecting nonlinear behavior of R.C structures
- 5- Basic assumptions considered throughout the nonlinear analysis of R.C plane frames
- 6- Idealization of stress strain curves for concrete in tension
- 7- Idealization of stress strain curves for concrete in compression
- 8- Idealization of stress strain curves for reinforcing steel
- 9- Biaxial stress- strain curves in 2 D nonlinear analysis
- 10- Equivalent uniaxial stress – strain curve
- 11- Derivation of secant and tangent elastic modulus
- 12- Displacement functions
- 13- Derivation of R.C plane frame stiffness matrix (Plastic and geometric stiffness matrix)
- 14- Calculation of layered element stiffnesses (axial – coupling and flexure stiffnesses)
- 15- Derivation of the load vector
- 16- Loading techniques
- 17- Algorithm and flow chart for nonlinear computer program for plain R.C frames
- 18- Layered element
- 19- Determination of stiffness's factors (A,B and)
- 20- Determination of the strain distribution
- 21- Determination of the stress distribution
- 22- Calculate of section capacity
