

# **EEC380: Industrial Training (1)**

## *Summer 2020*

**MATLAB**

**Industrial Control**

**Dr. Islam Mohamed**  
**Dr. Mohamed Selmy**

# Elements of Simulink

---

# Objectives

---

- Understand modeling and simulation of problems
- Use Simulink for understanding problems
- Use Simulink for solving problems
- Being able to use Simulink in Research and Work

# What is Simulink?

---

- Ordinary Differential Equations Solver (ODE)
- Block based Model description
- Non-Linear Models
- Real-time Code Generation

# Starting Simulink

From MATLAB command line

```
simulink
```

From Toolbar

From Simulink MDL file

Direct open of MDL file

```
(sim,simset/simget,open_system/load_system)
```

# Simulink Library Browser

New Model (CTRL+N)

Search Block by Name and Description

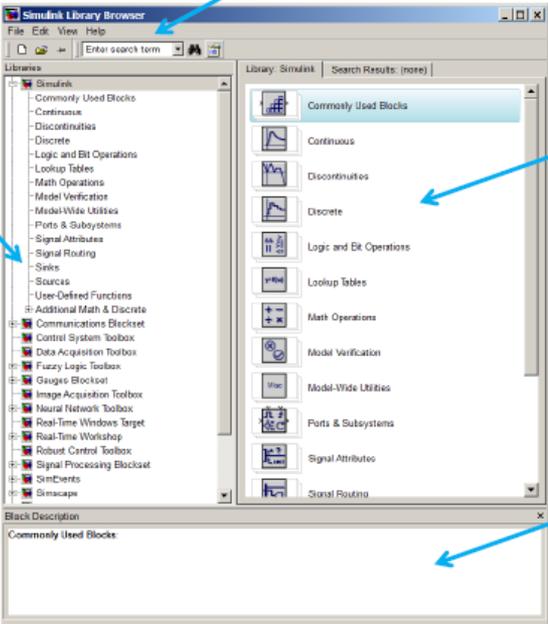

Library Tree

Block list

Description

The library browser manages the available blocks

Explore it for understanding and finding solutions

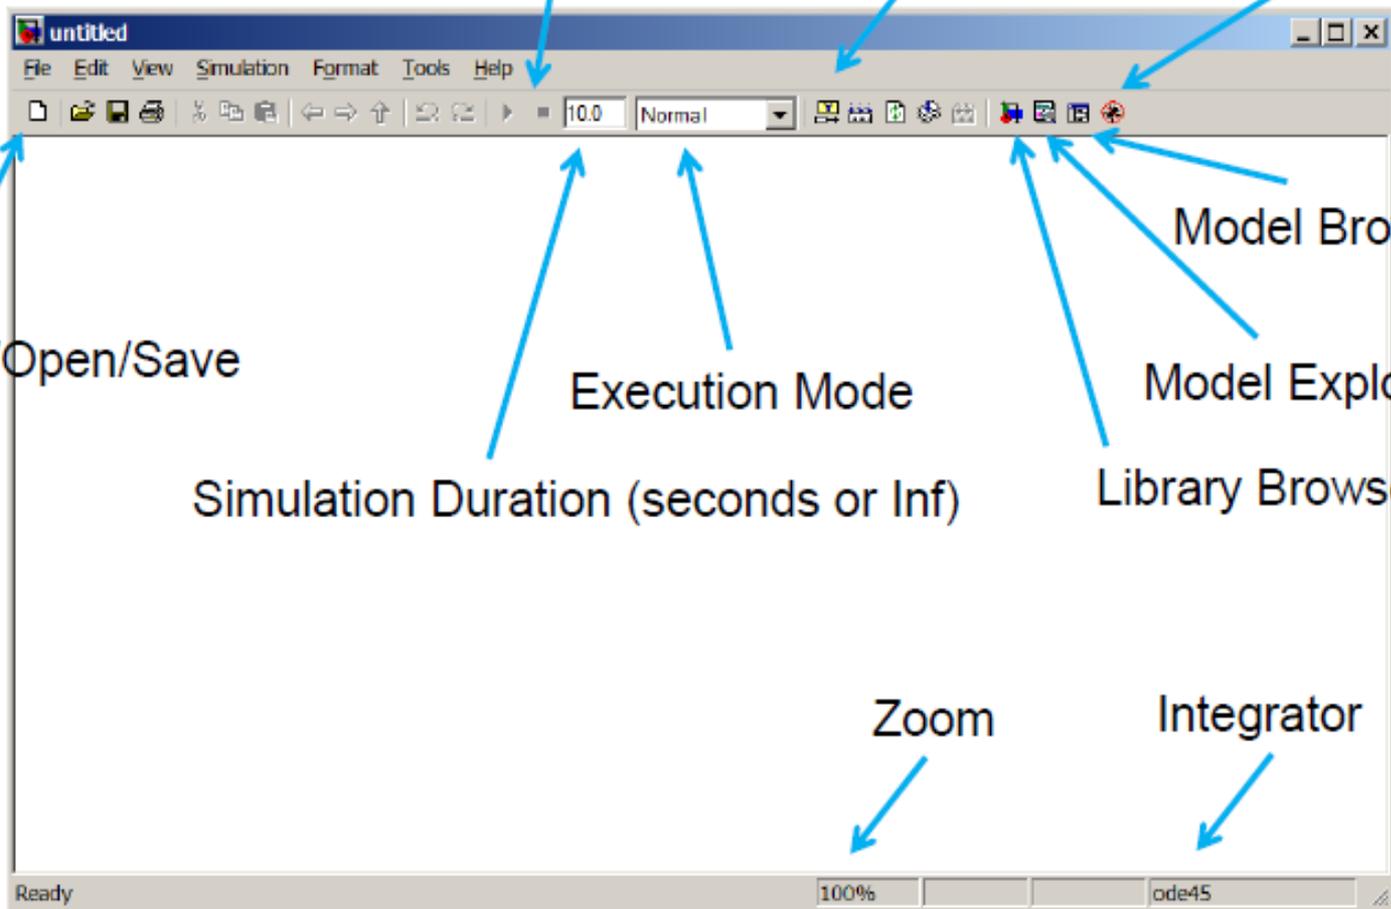

The screenshot shows the Simulink Library Browser interface. On the left is a 'Library Tree' listing various toolboxes and block categories. The main area displays a 'Block list' for the 'Commonly Used Blocks' category, including Continuous, Discontinuities, Discrete, Logic and Bit Operations, Lookup Tables, Math Operations, Model Verification, Model-Wide Utilities, Ports & Subsystems, Signal Attributes, and Signal Routing. At the bottom, a 'Block Description' pane is visible for the selected 'Commonly Used Blocks'.

- Simulink
  - Commonly Used Blocks
  - Continuous
  - Discontinuities
  - Discrete
  - Logic and Bit Operations
  - Lookup Tables
  - Math Operations
  - Model Verification
  - Model-Wide Utilities
  - Ports & Subsystems
  - Signal Attributes
  - Signal Routing
  - Sinks
  - Sources
  - User-Defined Functions
  - Additional Math & Discrete
- Aerospace Blockset
- CDMA Reference Blockset
- Communications Blockset
- Control System Toolbox
- Embedded Target for Infineon C1660
- Embedded Target for Motorola® HC1
- Embedded Target for Motorola® MPC
- Embedded Target for OSEK/VDX®
- Embedded Target for TI C2000 DSP
- Embedded Target for TI C6000 DSP

	XY Graph

# Building a Model

Drag and Drop blocks from Library Browser

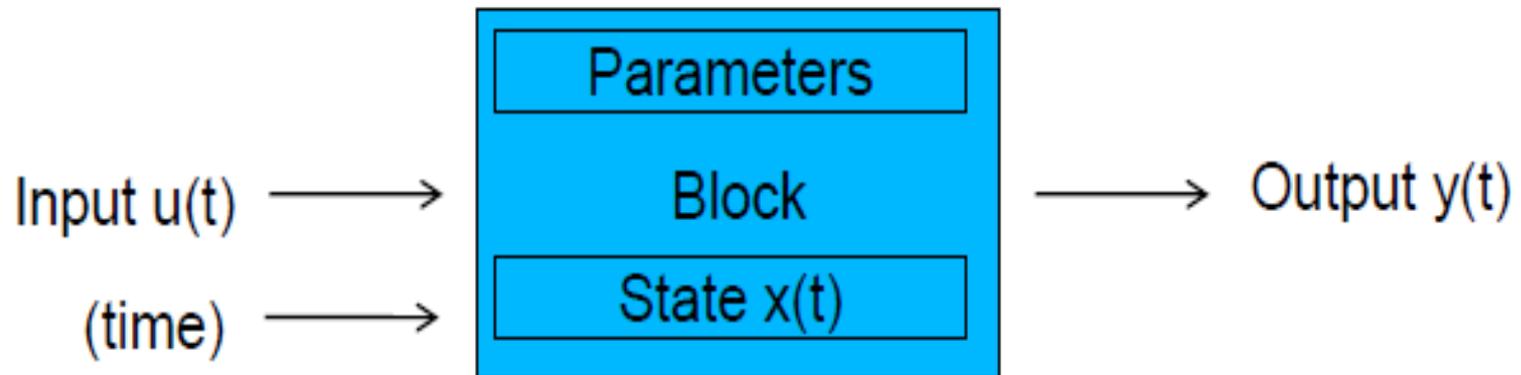

or activate context menu of block and select "Add to ..."

# Simulink Model based Design

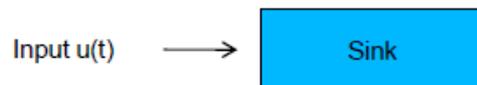

# Simulink Block

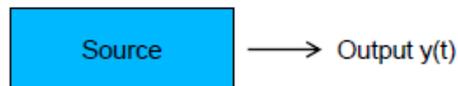

# Block Types

- Source – generate data
- Sink – receives data
- Virtual Block – perform cleanup
- Subsystem – aggregation of blocks (graphical or logical)
- Custom Blocks (S-Functions) – C or M-code based

Plot, Store, Send to Network ..., Goto

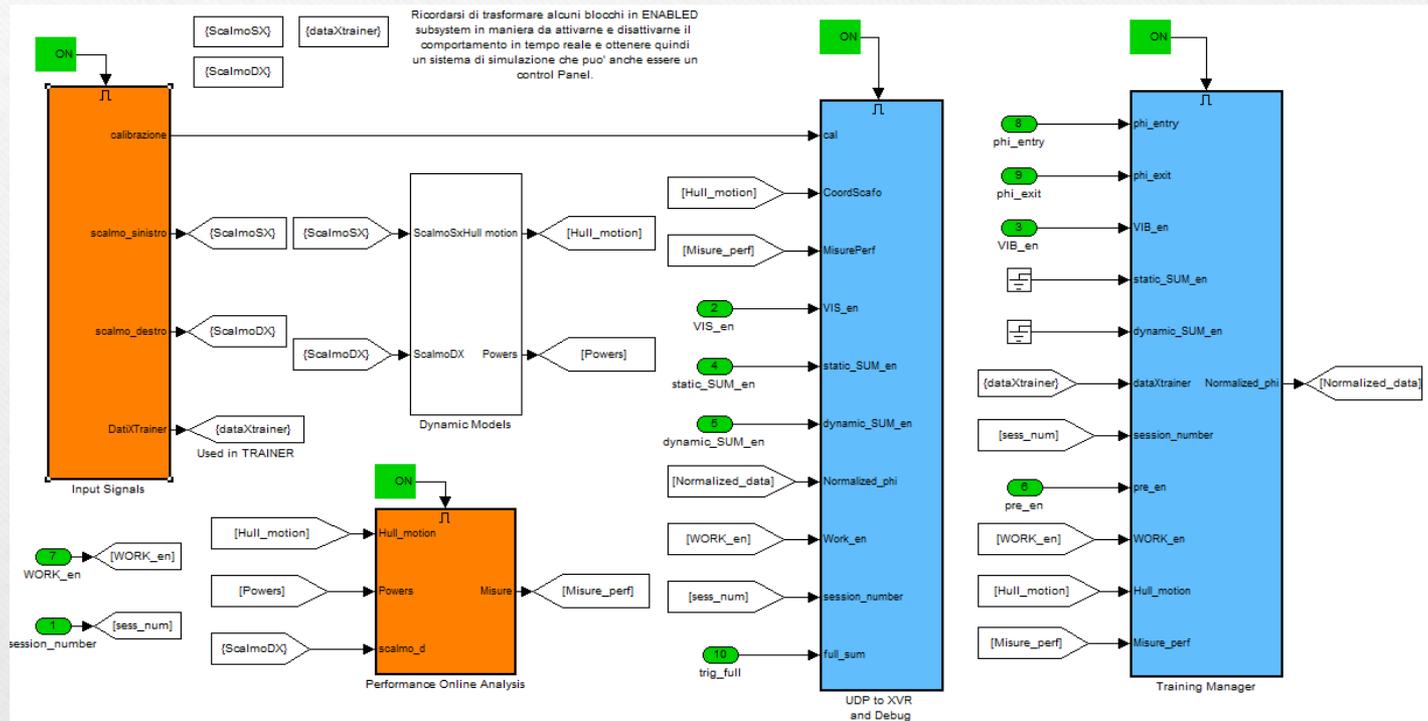

Load from File, Workspace, Curve  
Constant, ..., Label, From Network ...

All the others

# Example

# Manipulating Blocks

- Selection

- Multiple Selection with Shift
  - Multiple Selection with Box Selection
- 

- copy

- Drag with CTRL

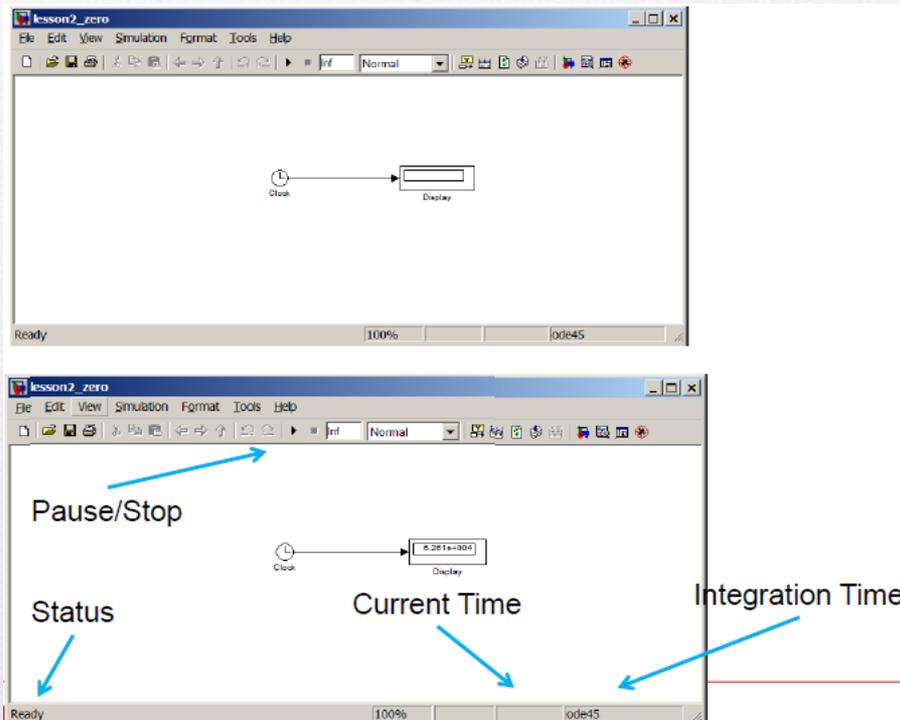

- Move Blocks

- Drag
- Rotate (CTRL+R)

- Connect Blocks

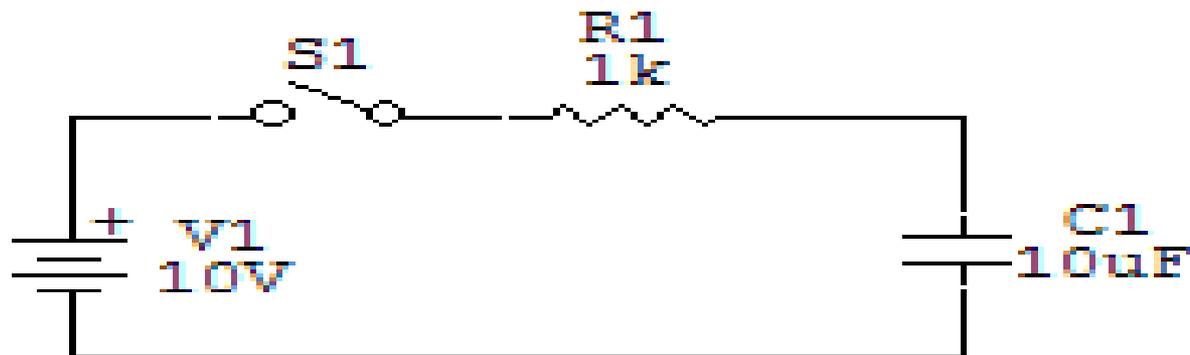

- Select first and select second using CTRL
- Branch line by holding CTRL from an existing line
- Disconnect block by drag a block holding SHIFT

# Running a Model

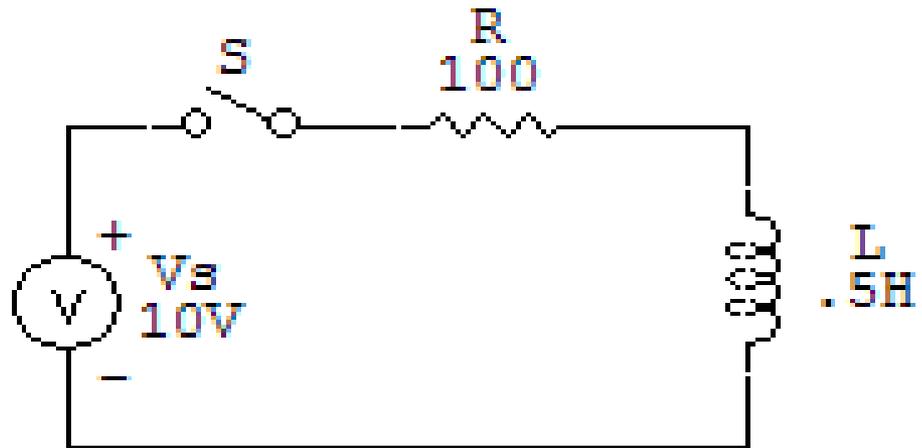

# Ex(1)

- Write the governing differential equation (DE) for the RC circuit shown in fig(3) when switch  $S_1$  is closed. Write a MATLAB script to analytically solve for the capacitor voltage and plot it against time. Compare the results with that obtained using Simulink( by two methods)
- Hint (use MATLAB simulink sim-power system & MATLAB continuous blocks)

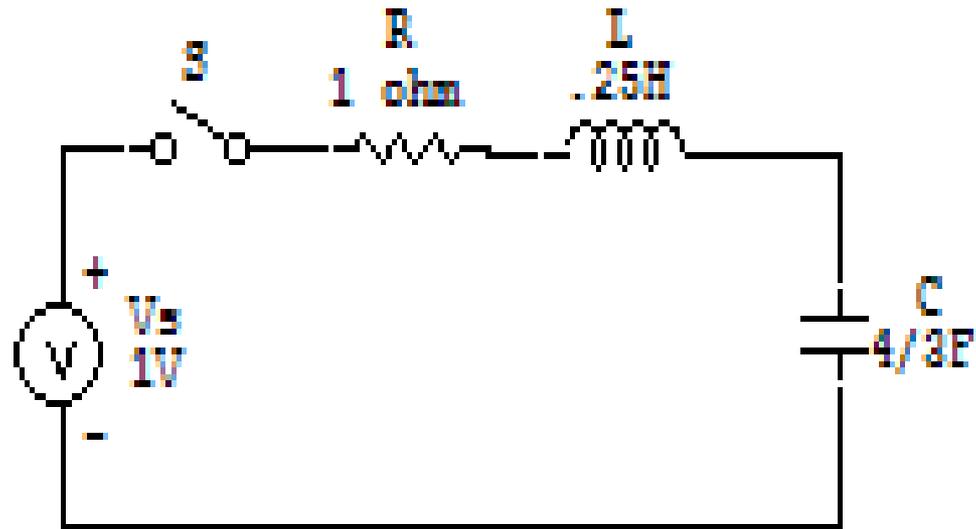

## Ex 2

- Write the governing differential equation (DE) for the RL circuit shown in fig(4) when switch  $S_1$  is closed. Write a MATLAB script to analytically solve for the capacitor voltage and plot it against time. Compare the results with that obtained using Simulink( by two methods)
- Hint (use MATLAB simulink sim-power system & MATLAB continuous blocks)

# Ex 3

- Repeat ex 3 in series RLC circuit fig(5)
- Using Simulink, find the current in the circuit and voltage across each element. Use the initial conditions  $i_L(0)=0$  and  $v_c(0)=0.5$  V

# EX 4

- Consider the following SISO system described by the differential equation. Use simulink to plot the output  $y(t)$  where  $u(t)$  is unit step function.
- 

$$\frac{d^4 y(t)}{dt^4} + 3\frac{d^3 y(t)}{dt^3} + 4\frac{d^2 y(t)}{dt^2} + 8\frac{dy(t)}{dt} + 2y(t) = 6u(t)$$

# Ex(5)

- For circuits shown in figures, use simulink sim-power system to find voltages at each node and the current through each resistor. All voltage and current sources are DC.

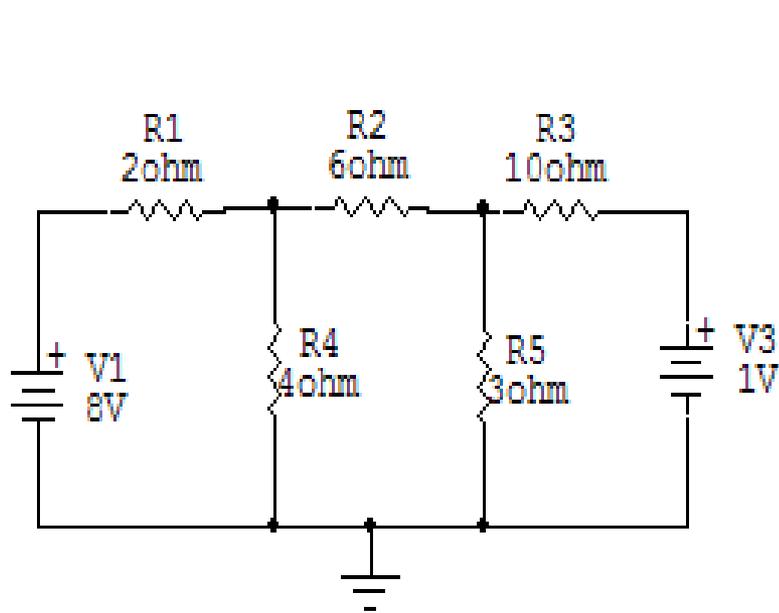

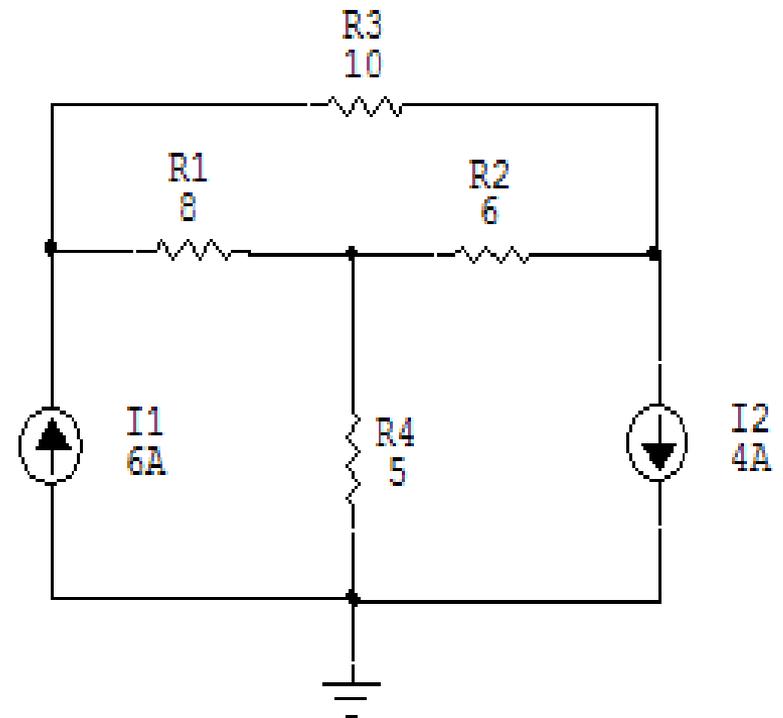

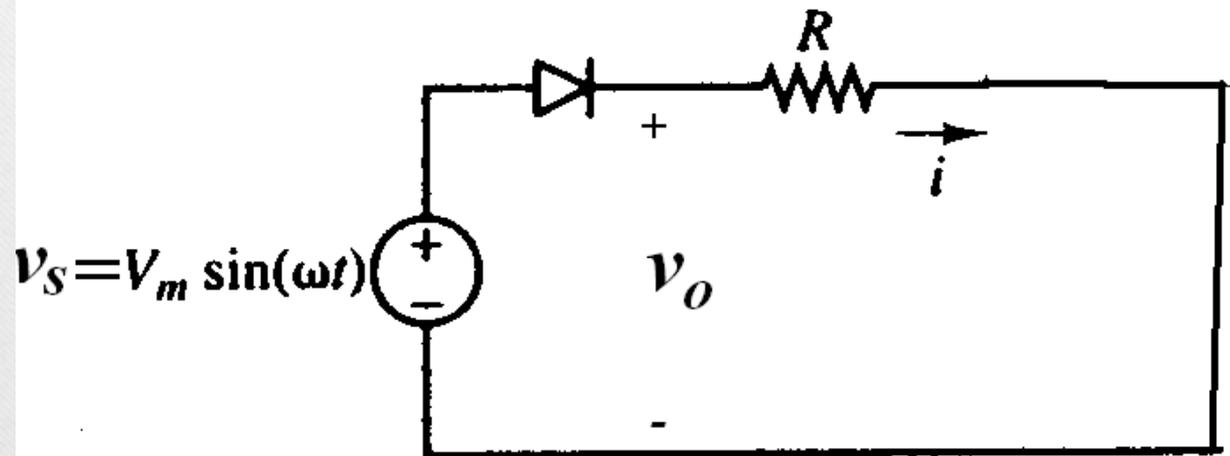

Fig 1

## EX 6

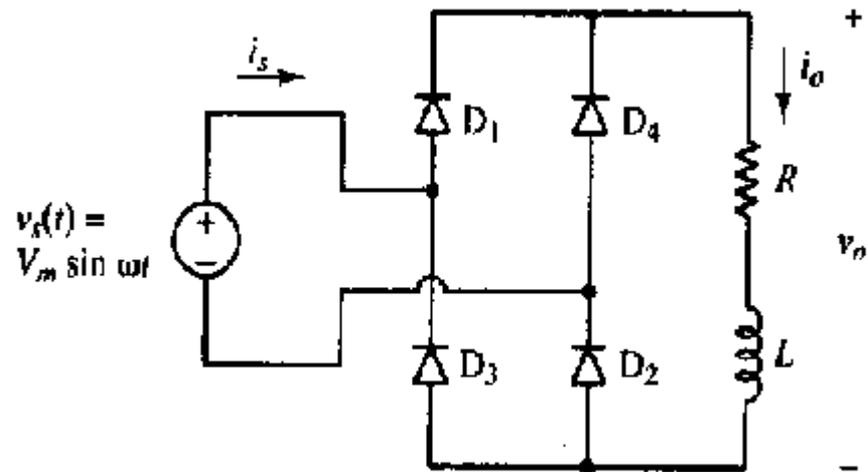

Plot the time variation of the load voltage, load current, and the voltage drop across the diode. If  $v_s = 120 \text{ V rms}$  at 60 Hz and  $R = 10 \Omega$ . use simulink

---

# Ex7

repeat problem 6 for the circuit shown  $L=0$  mH

# Ex8

◆ repeat problem 6 for the circuit shown
