# Contents

- Chapter 1:  
Transmission Line Constants
- Chapter 2:  
Transmission Line Models and Calculations
- Chapter 3:  
Mechanical Design of Overhead T.L
- Chapter 4:  
D.C. power Transmission Technology

# Chapter 1:

# Transmission Line Constants

# Inductance of stranded conductors

## Case 1: 3-strand cable

$$L = 2 * 10^{-7} \ln \frac{D_m}{D_s} \quad \text{H/m}$$

$$D_s = \sqrt[3]{r \cdot 2r \cdot 2r \cdot 2r \cdot r \cdot 2r \cdot 2r \cdot r \cdot 2r \cdot 2r} = \sqrt{(2r)^6 \cdot (r)^3}$$

$$D_s = \sqrt[9]{(2r)^6 \cdot (re^{-0.25})^3} \quad \text{where, } r = re^{-0.25}$$

$$D_m = \sqrt[3]{2r \cdot 2r \cdot 2r} = 2r$$

## Case 2: 7-strand cable

$$L = 2 * 10^{-7} \ln \frac{D_m}{D_s} \quad \text{H/m}$$

To get  $D_s$  we have 24 terms of  $2r$ , 12 terms of  $2\sqrt{3}r$   
6 terms of  $4r$ , and 7 terms of  $r$ .

$$D_s = \sqrt[7]{(re^{-0.25})^7 (2r)^{24} (2/\sqrt{3}r)^{12} (4r)^6}$$

# Self-GMD of Composite Stranded Conductors

## Two-stranded Composite conductor

$$D_s = \sqrt{(1+c)^2 (2r)^{2c} (re^{-0.25})^{1+c^2}}$$

## Seven-stranded Composite conductor

$$D_s = \sqrt{(6+c)^2 (2r * 6^{1/5})^{30} * (2r)^{12c} * (re^{-0.25})^{(6+c^2)}}$$

# Inductance of a Three-Phase Line:

## (a) balanced Three-Phase Line:

$$\lambda_a = 2 * 10^{-7} \left( I_a \ln \frac{1}{D_s} + I_b \ln \frac{1}{D} + I_c \ln \frac{1}{D} \right)$$

$$I_a + I_b + I_c = 0 \quad (\text{balanced})$$

$$\lambda_a = 2 * 10^{-7} \left( I_a \ln \frac{1}{D_s} - I_a \ln \frac{1}{D} \right)$$

$$= 2 * 10^{-7} I_a \ln \frac{D}{D_s}$$

$$L_a = \frac{\lambda_a}{I_a} = 2 * 10^{-7} \ln \frac{D}{D_s} \quad \text{H/m}$$

# Continue

$$L_t = L_a + L_b + L_c = 3L_a \quad (\text{balanced and identical})$$

$$X_{lt} = 2\pi f L_t \quad \Omega$$

## (b) Unbalanced Three-Phase Line

If the spacing of the transmission line conductors is not symmetrical, the linkages for different conductors would be different and unbalanced voltages would be produced under loading conditions.

# Continue

The unbalanced condition causes unequal reactances Which cause inductive interference with parallel communication circuits and also result in unbalanced-phase charging currents .

To reduce these effects , the three-phase line with unequal spacing are transposed .

$$\lambda_a = 2 * 10^{-7} I_a \ln \frac{\sqrt[3]{D_{ab} D_{bc} D_{ca}}}{D_s} \quad \text{Linkages / m}$$

# Continue

$$L_a = 2 * 10^{-7} \ln \frac{\sqrt{D_{ab} D_{bc} D_{ca}}}{D_s} \quad \text{H/m}$$

$$L_a = 2 * 10^{-7} \ln \frac{D_m}{D_s} \quad \text{H/ m}$$

Arrangement of three-phase line with 3 parallel conductors in each phase,

$$D_s \text{ of } A = \sqrt[3]{r_{a1} \cdot D_{a1a2} \cdot D_{a1a3} \cdot r_{a2} \cdot D_{a2a1} \cdot D_{a2a3} \cdot r_{a3} \cdot D_{a3a1} \cdot D_{a3a2}}$$

# Continue

$$D_s \text{ of } B = \sqrt[3]{r_{b1} \cdot D_{b1b2} \cdot D_{b1b3} \cdot r_b \cdot D_{b2b1} \cdot D_{b2b3} \cdot r_{b3} \cdot D_{b3b1} \cdot D_{b3b2}}$$

Using the same procedure to obtain  $D_S$  of C.

$$D_{AB} = \sqrt[3]{D_{a1b1} \cdot D_{a1b2} \cdot D_{a1b3} \cdot D_{a2b1} \cdot D_{a2b2} \cdot D_{a2b3} \cdot D_{a3b1} \cdot D_{a3b2} \cdot D_{a3b3}}$$

$$D_{BC} = \sqrt[3]{D_{b1c1} \cdot D_{b1c2} \cdot D_{b1c3} \cdot D_{b2c1} \cdot D_{b2c2} \cdot D_{b2c3} \cdot D_{b3c1} \cdot D_{b3c2} \cdot D_{b3c3}}$$

# Continue

Using the same procedure to obtain  $D_{ca}$

$$D_m = \sqrt[3]{D_{ab}D_{bc}D_{ca}}$$

If the system is fully transposed,

$$D_m = \sqrt[3]{D_{ab}D_{bc}D_{ca}}$$

$$X = 2\pi fL \quad \Omega / \text{phase}$$

# Capacitance of O.H.T.L

If the conductor has charge  $q$  C/ m , then, the dielectric flux density  $D$  at a distance  $X$  m is,

$$D = \frac{q}{2\pi X} \quad \text{C/m}^2$$

- Area which total flux passes being  $2\pi X \quad \text{m}^2$
- Unit charge situated in a field of unit electric flux Density in air its force is ,

$$36\pi * 10^9 \quad \text{V/m}$$

# Continue

The voltage gradient is given by,

$$\frac{dE}{dX} = 36\pi * 10^3 D = 36\pi * 12^3 * \frac{q}{2\pi X} = 18 * 10^3 \frac{q}{X} \quad \text{V/m}$$

Then ,

$$V_{AB} = \int \frac{dE}{dX} = \int_A^B 18 * 10^9 \frac{q}{X} dX = 18 * 12^9 q \ln \int_A^B = 18 * 10^9 q \ln \frac{B}{A}$$

$$E_{an} = 18 * 10^9 \sum_{k=a}^n q_k \ln \frac{D_{kn}}{D_{ka}}$$

$$C = \frac{q}{E} \quad \text{farad}$$

# Capacitance of Two Parallel Conductors

$$\begin{aligned}E_{AB} &= 18 * 10^9 \left( q_A \ln \frac{D}{r} - q_B \ln \frac{D}{r} \right) \\&= 18 * 10^9 \left( q_A \ln \frac{D}{r} + q_B \ln \frac{D}{r} \right) \\&= 18 * 10^9 \left( 2q_A \ln \frac{D}{r} \right) \\E_{AB} &= 36 * 10^9 q_A \ln \frac{D}{r}\end{aligned}$$

# Continue

$$C_{AB} = \frac{q_A}{E_{AB}} = \frac{q_A}{36 * 10^9 q_A \ln \frac{D}{r}}$$

$$C_{AB} = \frac{1}{36 * 10^9 \ln \frac{D}{r}} \quad \text{F/m}$$

$$C_{AN} = \frac{q_A}{E_{AB} / 2} = \frac{1}{18 * 10^9 \ln \frac{D}{r}}$$

# Capacitance of Three-Phase Line

## (a) Balanced Three-Phase Line

$$E_{AN} = E_{BN} = E_{CN}$$

$$q_A + q_B + q_C = 0$$

$$C_{AN} = C_{BN} = C_{CN}$$

$$C_{AN} = \frac{1}{18 * 10^9 \ln \frac{D}{r}}$$

## (b) Unbalanced Three-Phase Line

1

$D_s$

$$D_m = \sqrt[3]{D_{AB} D_{BC} D_{CA}}$$

## Capacitance of a Single-Phase Line with Earth Return

$$C_{AN} = \frac{1}{18 * 10^9 \ln \frac{2h}{r}} \quad \text{F/m}$$

# Capacitance of Multi-Circuit Three-Phase Line

Ph (1).....aa'

Ph (2).....bb'

Ph (3).....cc'

$$C_{AN} = \frac{1}{18 * 10^9 \text{ Ln} \frac{D_m}{D_s}} \quad \text{F/ m/ ph}$$

$$D_m = \sqrt[3]{D_{AB} D_{BC} D_{CA}}$$

# Continue

$$\begin{aligned} D_{AB} &= 2^*2\sqrt{D_{ab}D_{ab'}D_{a'b}D_{a'b'}} \\ &= \sqrt[4]{D.\sqrt{3}D.\sqrt{3}D.D} = (3)^{\frac{1}{4}} D \end{aligned}$$

$$\begin{aligned} D_{BC} &= 2^*2\sqrt{D_{bc}.D_{bc'}D_{b'c}D_{b'c'}} \\ &= \sqrt[4]{\sqrt{3}D.D.D.\sqrt{3}D} = (3)^{\frac{1}{4}} D \end{aligned}$$

Using the same procedure to obtain  $D_{CA}$

# Continue

$$\begin{aligned} D_s \text{ of } A &= \sqrt[2]{r_a D_{AA'} \cdot r_{a'} D_{A'A}} \\ &= \sqrt[4]{r^2 (2D)(2D)} = \sqrt{(2D)r} \end{aligned}$$

Using the same procedure to obtain SGMD of circuit B, and C.

## Comparison of Relations for Inductance and Capacitance

The term  $\frac{D_m}{D_s}$  appears in inductance and capacitance

Such that, for inductance,  $r = r e^{-0.25}$   
 for capacitance,  $r = r$  (conductor radius)

$$L * C = \frac{1}{9 * 10_{16}} = \frac{1}{V^2}$$

Where,  $V$  : velocity of light

$$\therefore \text{Capacitive reactance } X_c = \frac{1}{2\pi f C} \quad \Omega$$

$$\text{the charging current / phase} = \frac{V}{X_c} = V * 2\pi f C \quad \text{A}$$
