

**Benha University**

*Dr. Mohamed Ahmed Ebrahim*

Undergraduate Course

# ***Solar Cells Fundamental***

***Dr. Mohamed Ahmed Ebrahim***

E-mail: [mohamedahmed\\_en@yahoo.com](mailto:mohamedahmed_en@yahoo.com)

Web site: <http://bu.edu.eg/staff/mohamedmohamed033>

*Dr. Mohamed Ahmed Ebrahim*

# Lecture (1)

*Dr. Mohamed Ahmed Ebrahim*

# Content

- 1 • **Sunlight energy.**
- 2 • **Photovoltaic devices.**
- 3 • **Energy conversion.**
- 4 • **Solar radiation measurement.**
- 5 • **Solar cell application.**
- 6 • **Principles of solar cell operation.**
- 7 • **Principles of solar cell structure.**
- 8 • **Electrical and optical characteristics of solar cell.**
- 9 • **Solar cell equivalent circuit.**
- 10 • **Solar cell standards.**
- 11 • **Calibration and testing of solar cell.**
- 12 • **Different types of solar cells (crystalline silicon & thin film).**

# Content

- 13 • ***Energy production by a PV array.***
- 14 • ***Energy balance in stand alone PV systems.***
- 15 • ***Calibration and testing of PV modules.***
- 16 • ***PV system monitoring.***
- 17 • ***Safety considerations in PV system.***
- 18 • ***Site assessment***
- 19 • ***System design***
- 20 • ***Maximizing cell efficiency.***
- 21 • ***Types and adaptation of PV.***
- 22 • ***PV circuits properties.***
- 23 • ***PV applications and systems.***
- 24 • ***Social and environment aspects.***

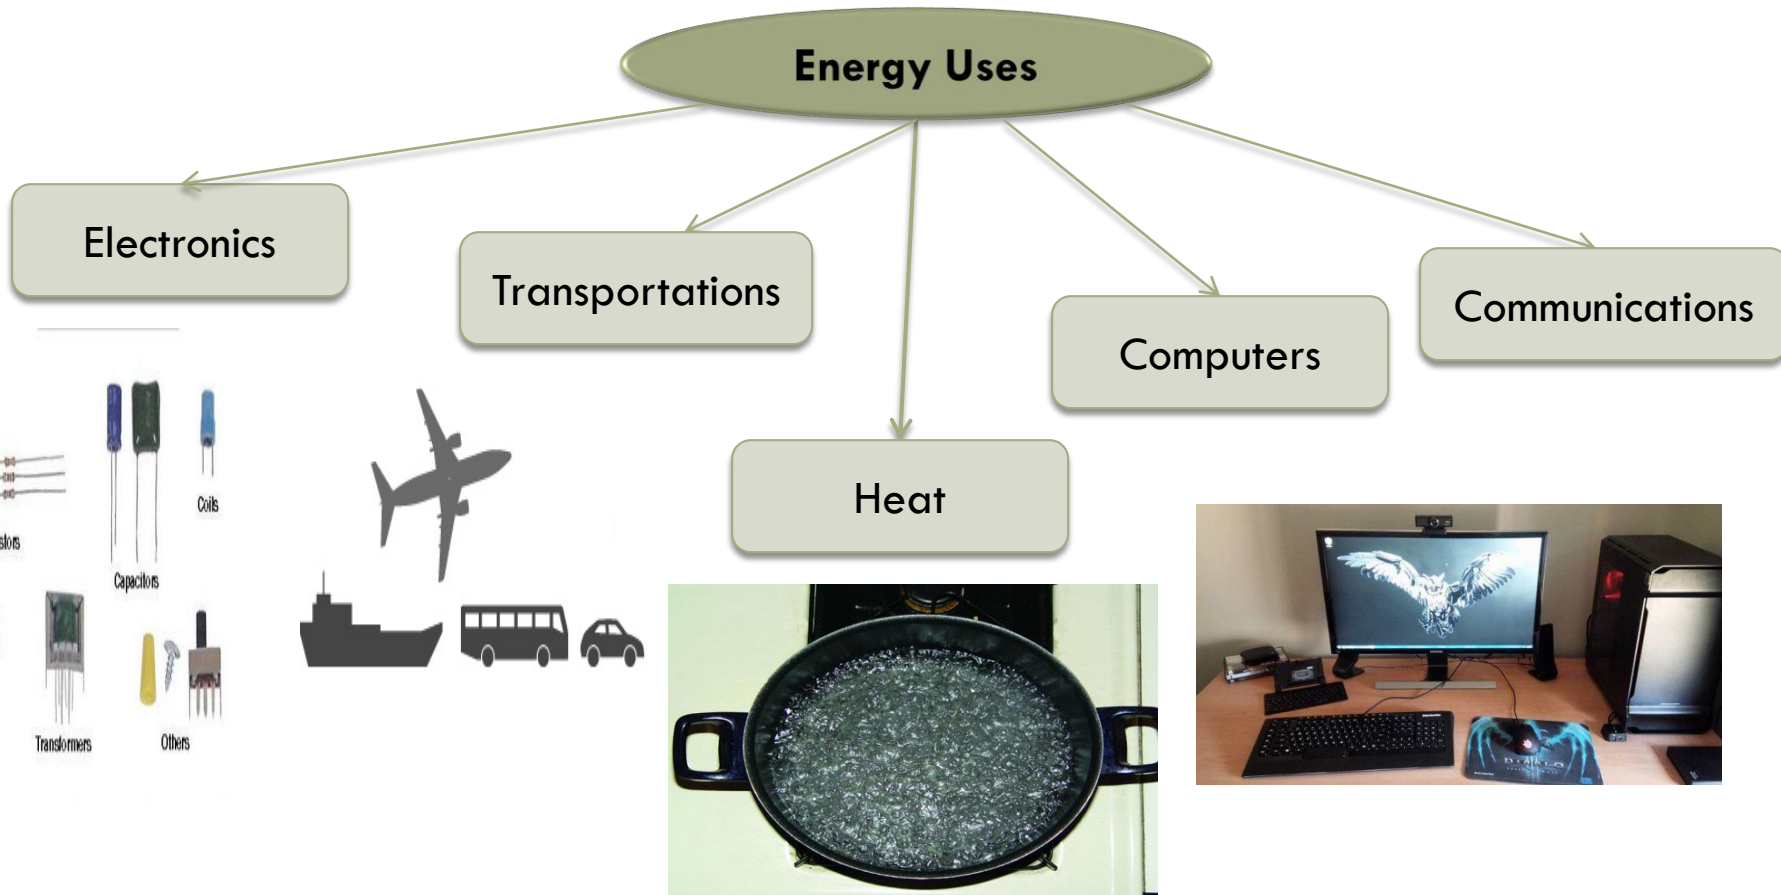

# INTRODUCTION

*Dr. Mohamed Ahmed Ebrahim*

# Energy Definition

- Energy is the amount of force or power when applied can move one object from one position to another.
- Energy defines the capacity of a system to do work.
- Energy are broadly classified into two main types:
  - Renewable Energy
  - Non Renewable Energy

# Energy Applications

# Common Forms of Energy

The six most common forms of energy:

Chemical

Kinetic

Rotational

Solar

Thermal

Nuclear

*Electricity*  
*Changes*  
*Life style*

## Five key questions

```
graph TD; A[Five key questions] --- B[1. What is the electrical energy?]; A --- C[2. How do we produce electric energy?]; A --- D[3. Why do we think the electrical energy is important?]; A --- E[4. What are the resources of electrical energy?]; A --- F[5. What about renewable energy resources?];
```

**1. What is the electrical energy?**

**2. How do we produce electric energy?**

**3. Why do we think the electrical energy is important?**

**4. What are the resources of electrical energy?**

**5. What about renewable energy resources?**

# 1. What is the Electric Energy?

- It is one of the most important energy forms.
- Energy cannot be created or destroyed.
- In all devices and machines, including electric circuits, energy is transferred from one type to another.

ELECTRICAL ENERGY

# The Idea

**Electricity is flowing Electrons**

*Dr. Mohamed Ahmed Ebrahim*

# Terminology

## 1. Voltage

- Measured in Volts.
- Electrical potential.
- “Height” of water on one side of a dam compared to the other side.

## 2. Current

- Measured in Amps.
- Rate of electron flow.
- “Speed” at which water flows through the dam.

### 3. Resistance

- The opposition of a material to the flow of an electrical current.
- Depends on
  - \* Material
  - \* Cross sectional area
  - \* Length
  - \* Temperature

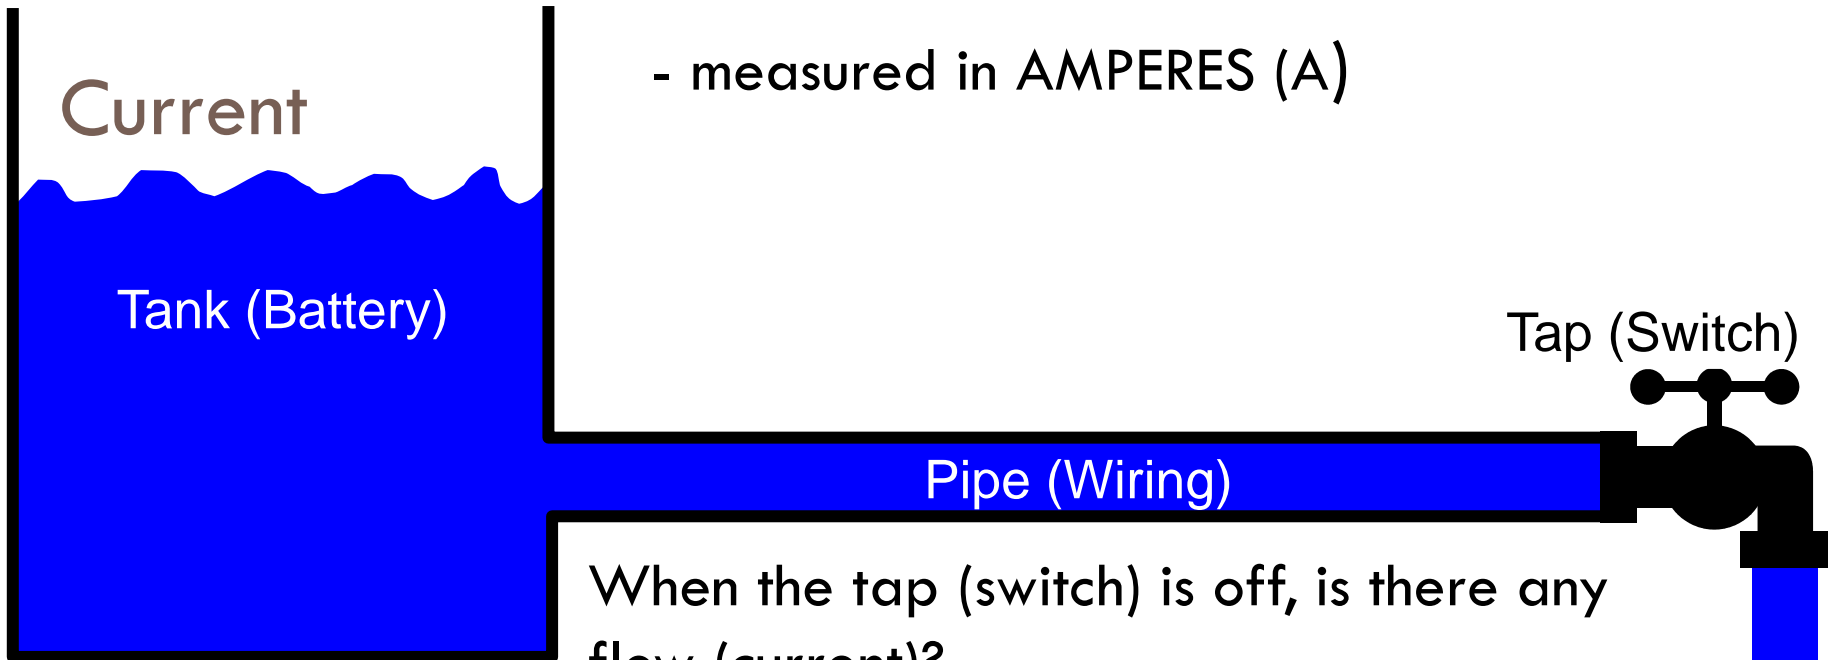

#### 4. Watt

- Measure of Power.
- Rate of electrical energy.
- Not to be confused with Current.
- Watt-hour (Wh) is a measure of energy:
  - \* Unit quantity of electrical energy (consumption and production).
  - \* Watts x hours = Watt-hours.
  - \* 1 Kilowatt-hour (kWh) = 1000 Wh

## The flow of electric charge

- measured in AMPERES (A)

When the tap (switch) is off, is there any flow (current)?

**NO**

When the tap (switch) is on, is there any flow (current)?

**YES**

# Current in a Circuit

When the switch is off, there is no current.

When the switch is on, there is current.

## 2. How do We Produce Electric Energy?

**Magnetic field + movable conductor = electricity**

### Edison and Swan

Nearly 40 years went by before a really practical DC (Direct Current) generator was built by Thomas Edison. In 1878 Joseph Swan, a British scientist, invented the incandescent filament lamp and within twelve months Edison made a similar discovery in America.

*Dr. Mohamed Ahmed Ebrahim*

- Swan and Edison later set up a joint company to produce the first practical filament lamp. Prior to this, electric lighting had been crude arc lamps.
- Edison used his DC generator to provide electricity to light his laboratory and later to illuminate the first New York street to be lit by electric lamps, in September 1882. Edison's successes were not without controversy, however - although he was convinced of the merits of DC for generating electricity, other scientists in Europe and America recognized that DC brought major disadvantages.

### 3. Why do we think the Electrical Energy is important?

- Electricity is a part of modern life and one cannot think of a world without it.
- Electricity has many uses in our day to day life.
- We can say that the electric energy is the source of life.
- Imagine life without electricity!!!!!!!!!!!!

## 4. What are the resources of electrical energy ?

*Electric energy resources can be classified as*

*According to its nature*

*Non-renewable*

Most of our electricity comes from the burning of the fossil fuels coal and gas.

*Renewable*

## 1. Non-renewable energy & its types

- Sources are not environmental friendly and can have serious affect on our health.
- They are called non-renewable because they can not be re-generated within a short span of time.
- Non-renewable sources exist in the form of fossil fuels, natural gas oil and coal.

## 2. Renewable energy & its types

- Recourses found in nature i.e. Sun, wind, rain, and tides. That are self regenerated, that can be replaced or renewed without harming the environment or contributing to the greenhouse effect.
- These sources are normally used to produce clean energy. This production doesn't lead to climate change.

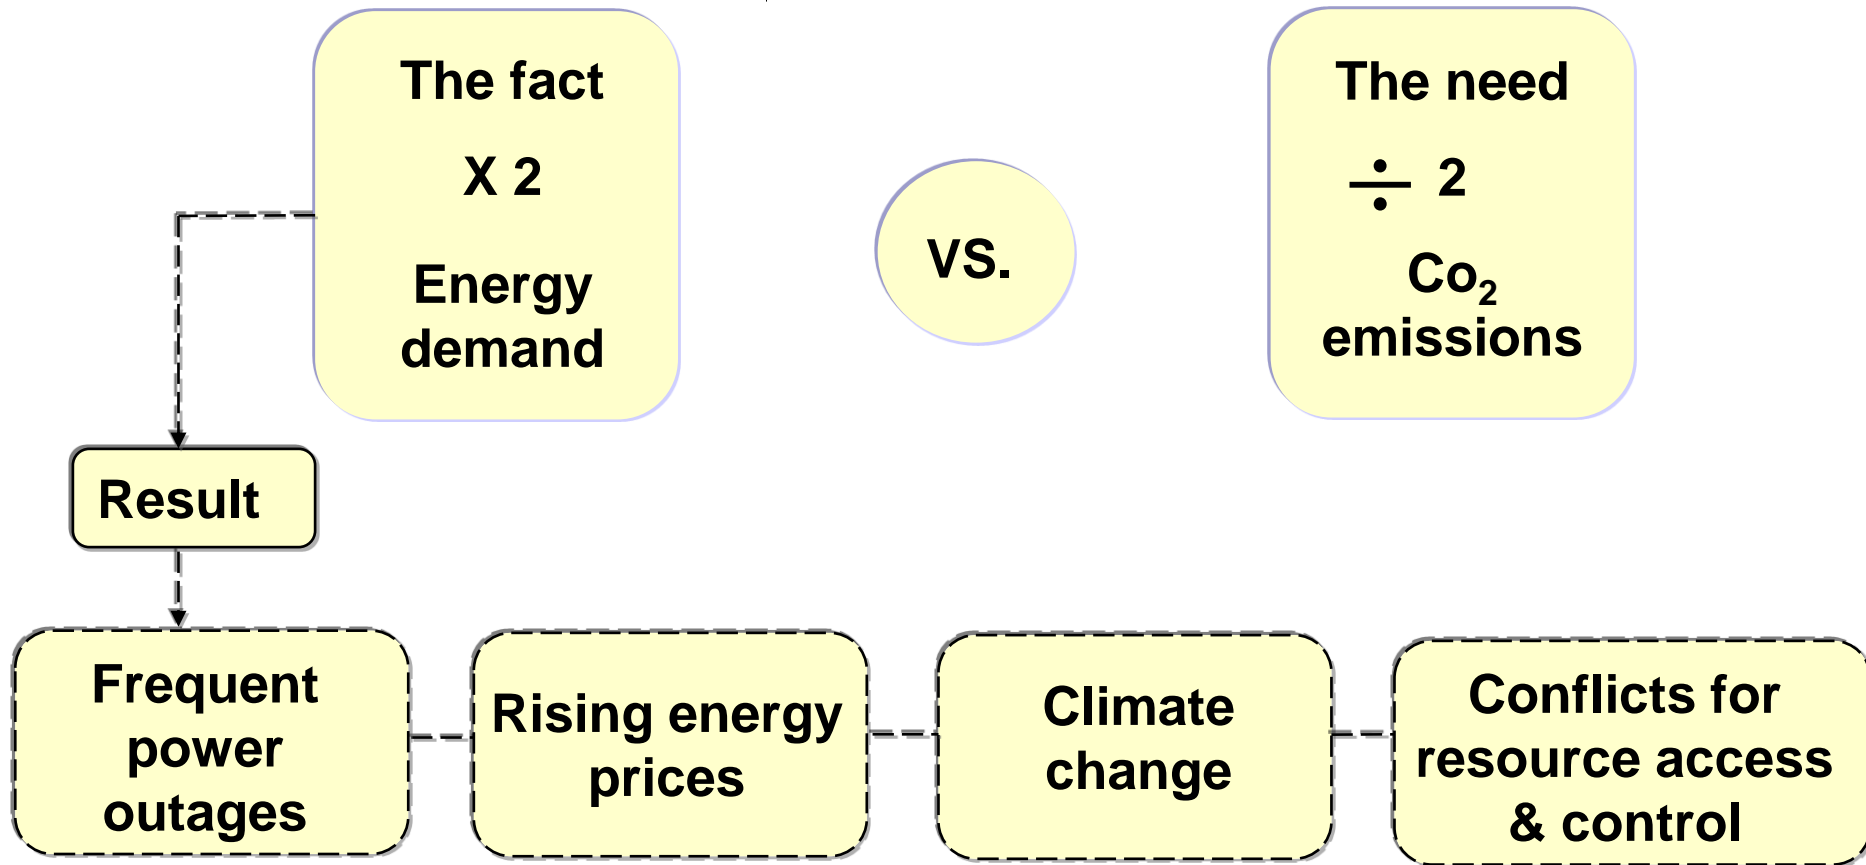

## What's wrong with this picture?

- Pollution from burning fossil fuels leads to an increase in greenhouse gases, acid rain, and the degradation of public health.
- Egypt carbon dioxide emissions is at a current level of 212.15M, up from 209.77M one year ago. This is a change of 1.13% from one year ago.

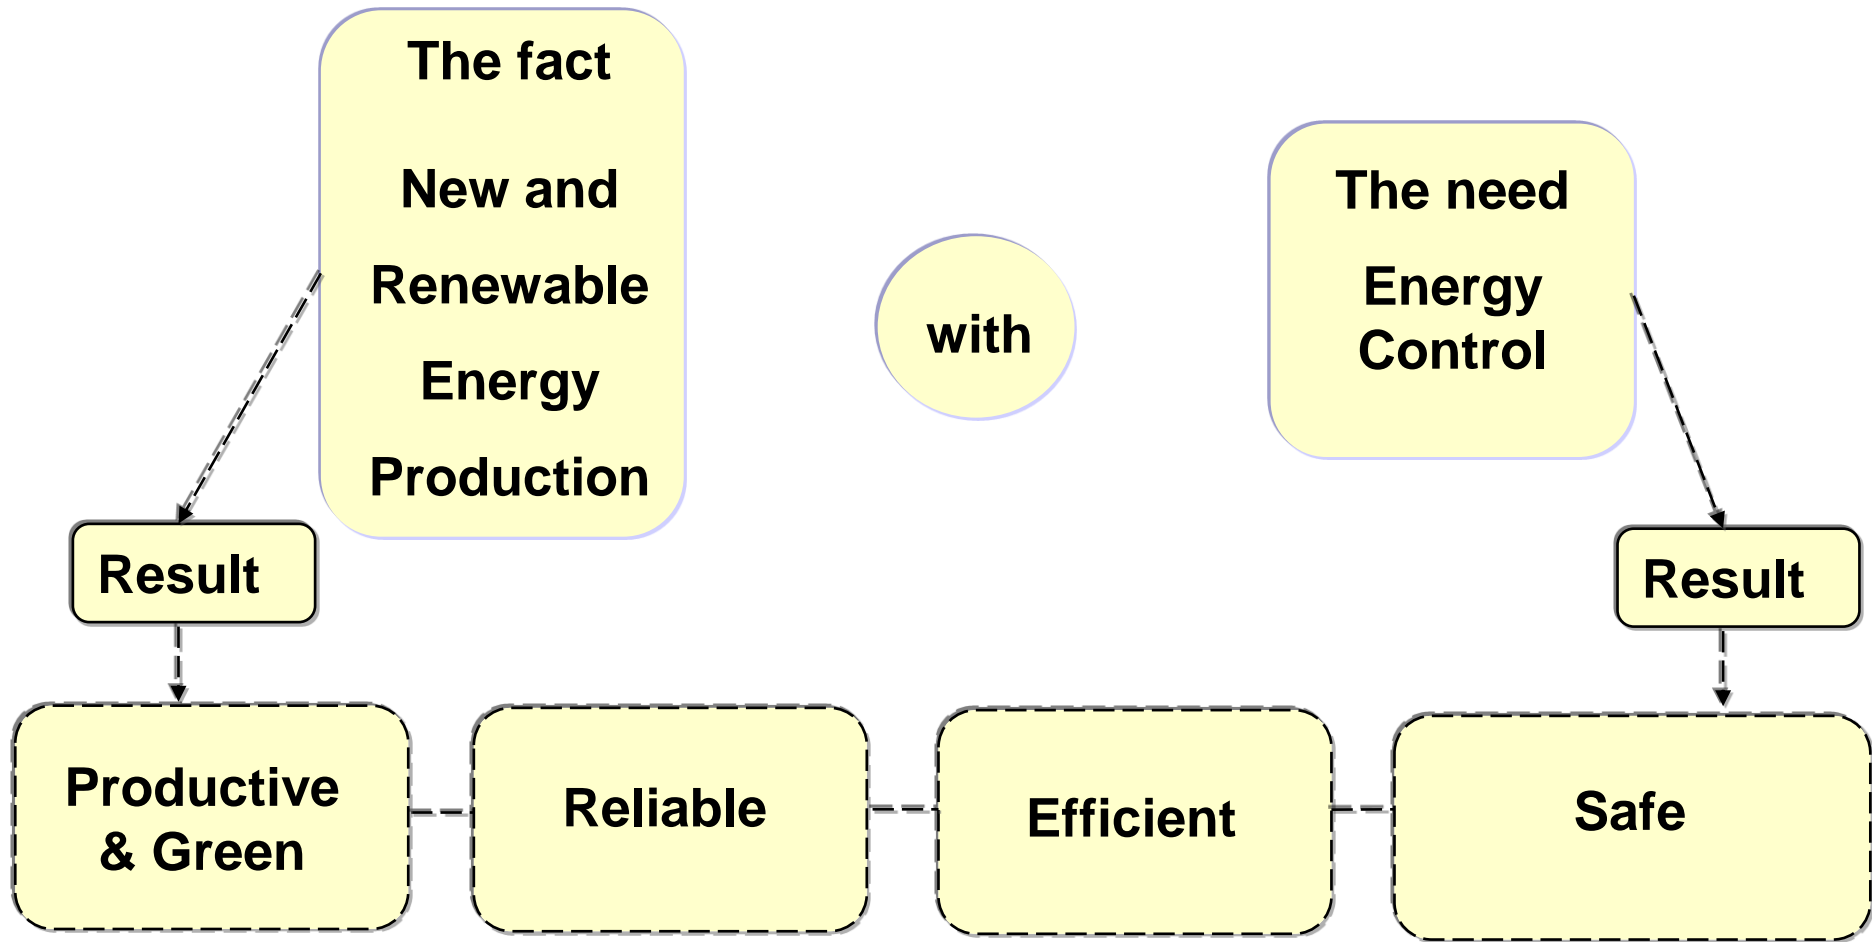

*Dr. Mohamed Ahmed Ebrahim*

# Energy Dilemma

# Proposed Solution

## Classifications of main drivers behind the focus on renewable energy

### Environmental drivers

- ❖ Limiting green house gas (GHG) emissions
- ❖ Avoidance of the construction of new transmission circuits and large generating plants

### Commercial drivers

- ❖ General uncertainty in electricity markets favours small generation schemes
- ❖ DG is a cost effective route to improved power quality and reliability

### National/regulatory drivers

- ❖ Diversification of energy sources to enhance energy security
- ❖ Support for competition policy

# Why Sustainable Energy Matters?

- The world's current energy system is built around fossil fuels  
Problems:
  1. Fossil fuel reserves are ultimately finite.
  2. Two-thirds of the world's proven oil reserves are located in the Middle-East and North Africa (which can lead to political and economic instability).
  3. Detrimental environmental impacts (mining operations & Combustion).

## Energy Matters

*Dr. Mohamed Ahmed Ebrahim*

# Making the Change to Renewable Energies
