

## Answer

(1)

The line $\mathrm{x}+2 \mathrm{y}=2$, when $\mathrm{x}=0$ then $\mathrm{y}=1$ and when $\mathrm{x}=2$ then $\mathrm{y}=0$. Then it passes through the points $(0,1),(2,0)$.
The line $-x+3 y=6$, when $x=0$ then $y=2$ and when $x=3$ then $y=3$. Then it passes through the points $(0,2),(3,3)$.
The line $\mathrm{x}-\mathrm{y}=4$, when $\mathrm{x}=0$ then $\mathrm{y}=-4$ and when $\mathrm{x}=4$ then $\mathrm{y}=0$.
Then it passes through the points $(0,-4),(4,0)$.

Then, we determine the feasible domain $M$ of vertices: $A(2,0), B(4,0), C(9,5), D(0,2)$ and $\mathrm{E}(0,1)$, see the figure.
The equation of the objective function $x+2 y=0$, when $x=2$ then $y=-1$. Then it passes through the points $(0,0)$ and $(2,-1)$ and can be traced as in figure.
Since the coefficients of the objective function f are 1 and 2 . Then the point $(1,2)$ lies in the first quarter which is the increasing direction of $f$. Then, the last point of intersection of the feasible domain M and the objective function f is the vertex $\mathrm{C}(9,5)$ which is the optimal solution. The optimal value of f is 19 .
(2)The standard form of this problem is:
$\operatorname{minimize} f=x-y-z$

$$
\text { s.t } \begin{aligned}
& 2 \mathrm{x}-\mathrm{y}+\mathrm{z}+\mathrm{s}_{1} \quad=4 \\
& \mathrm{x}+2 \mathrm{y}+2 \mathrm{z}+\mathrm{s}_{2}==10 \\
&-\mathrm{x}+\mathrm{y}-\mathrm{z}+\quad \mathrm{s}_{3}=8, \quad \mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{~s}_{1}, \mathrm{~s}_{2}, \mathrm{~s}_{3} \geq 0
\end{aligned}
$$

The steps of the simplex method goes as follows:

| B.V | x | y | z | s 1 | s 2 | s 3 | Solu |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| S1 | 2 | -1 | 1 | 1 | 0 | 0 | 4 |
| s2 | 1 | 2 | 2 | 0 | 1 | 0 | 10 |
| s3 | -1 | 1 | -1 | 0 | 0 | 1 | 8 |
| f | -1 | 1 | 1 | 0 | 0 | 0 | 0 |
| z | 2 | -1 | 1 | 1 | 0 | 0 | 4 |
| s2 | -3 | 4 | 0 | -2 | 1 | 0 | 2 |
| S3 | 1 | 0 | 0 | 1 | 0 | 1 | 12 |
| f | -3 | 2 | 0 | -1 | 0 | 0 | -4 |
| z | $5 / 4$ | 0 | 1 | $1 / 2$ | $1 / 4$ | 0 | $9 / 2$ |
| y | $-3 / 4$ | 1 | 0 | $-1 / 2$ | $1 / 4$ | 0 | $1 / 2$ |
| s3 | 1 | 0 | 0 | 1 | 0 | 1 | 12 |
| f | $-3 / 2$ | 0 | 0 | 0 | $-1 / 2$ | 0 | -5 |

This is the optimum case. Then the optimal solution is:
$\left(\mathrm{x}^{*}, \mathrm{y}^{*}, \mathrm{z}^{*}\right)=(0,1 / 2,9 / 2)$ or $(0,5,0)$ with optimal value $\mathrm{f} *=-5$
(3)The standard form of this problem is:
$\operatorname{maximize} \mathrm{f}=\mathrm{x}+\mathrm{y}+\mathrm{z}-\mathrm{u}$
s.t $\mathrm{x}-\mathrm{y}+\mathrm{z}-\mathrm{u}+\mathrm{s} 1 \quad=4$

$$
x+y-z+u-t+v=6, \quad x, y, z, u, s 1, t, v \geq 0
$$

where S 1 are slack variable, t is surplus variable and v is artificial variable.
Let $w=v$. Then, the objective of phase one is:

$$
w+x+y-z+u-t=6
$$

The steps of phase one goes as table:

| B.V | x | y | z | u | t | S 1 | v | Solu |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| S 1 | 1 | -1 | 1 | -1 | 0 | 1 | 0 | 4 |
| v | 1 | 1 | -1 | 1 | -1 | 0 | 1 | 6 |
| f | -1 | -1 | -1 | 1 | 0 | 0 | 0 | 0 |
| w | 1 | 1 | -1 | 1 | -1 | 0 | 0 | 6 |
| x | 1 | -1 | 1 | -1 | 0 | 1 | 0 | 4 |
| V | 0 | 2 | -2 | 2 | -1 | -1 | 1 | 2 |
| f | 0 | -2 | 0 | 0 | 0 | 1 | 0 | 4 |
| w | 0 | 2 | -2 | 2 | -1 | -1 | 0 | 2 |
| x | 1 | 0 | 0 | 0 | $-1 / 2$ | $1 / 2$ | $1 / 2$ | 5 |
| y | 0 | 1 | -1 | 1 | $-1 / 2$ | $-1 / 2$ | $1 / 2$ | 1 |
| f | 0 | 0 | -2 | 2 | -1 | 0 | 1 | 6 |
| w | 0 | 0 | 0 | 0 | 0 | 0 | -1 | 0 |

This is the end of phase one. Phase two starts with the following table which is formed by deleting the column of $v$ and the w-row.

| B.V | x | y | z | u | t | S 1 | Solu |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| x | 1 | 0 | 0 | 0 | $-1 / 2$ | $1 / 2$ | 5 |
| y | 0 | 1 | -1 | 1 | $-1 / 2$ | $1 / 2$ | 1 |
| f | 0 | 0 | -2 | 2 | -1 | 0 | 6 |

There is no optimal solution because the coefficient of $z$ in $f$-equation is negative but the pivoting operation can not be cared.
The feasible solution is $(x, y, z, u)=(5,1,0,0)$ with value $\mathrm{f} *=6$.
