## Lecture No: 10

## STRENGTH OF FIGURE \& SATELLITE STATION

Dr. Eng. Reda FEKRY

reda.abdelkawy@feng.bu.edu.eg

## Overview of Previous lecture

## TRIGONOMETRIC LEVELING

## TRIGONOMETRIC LEVELING - OBSERVATION METHODS

## TRIGONOMETRIC LEVELING - CORRECTIONS

TRIGONOMETRIC LEVELING - NUMERICAL EXERCISE

## PRECISE LEVELING

## PRECISE LEVELING - EQUIPMENT

## APPLICATIONS OF PRECISE LEVELING

## OVERVIEW OF TODAY’S LECTURE

## STRENGTH OF FIGURE

## COMPUTATION OF STRENGTH OF FIGURE

NUMERICAL EXERCISES ON STRENGTH OF FIGURE

## SATELLITE STATION PROBLEM

## SIGNIFICANCE OF SATELLITE STATION

## REDUCTION TO CENTER

NUMERICAL EXERCISES ON SATELLITE STATION

## Expected Learning OUTCOMES

1. Understanding the concept of strength of figure in triangulation networks.
2. Learning about the factors that contribute to the strength of a figure such as geometry.
3. Understanding the fundamental equations and mathematical models used to compute the strength of figures.
4. Understanding the concept of satellite stations and reduction to center.
5. Understanding the impact of satellite stations on the establishment of geodetic control.

## (1) Strength of Figure

Hexagon

## Strength of Figure

$>$ A measure of the judicious selection of the framework consisting of triangles and quadliterals employed for triangulation.
$>$ Determination of the figure which gives the least error in calculated length of last line in the system due to the shape of triangles and computation of the figures.

$$
R=F \sum\left(\delta_{A}^{2}+\delta_{A} \delta_{B}+\delta_{B}^{2}\right)
$$

R: Strength of Figure
F: Strength of Figure Factor $\mathrm{F}=\frac{D-C}{D}$
$\delta_{A} \delta_{B}$ : The logarithmic differences corresponding to $1^{\prime \prime}$ for distance angles A and B

## Strength of Figure

$>$ F: Strength of Figure Factor $\mathrm{F}=\frac{D-C}{D}$
D: total number of observed directions except the base line
C: total number of conditions $C=\left(L^{\prime}-S^{\prime}+1\right)+(L-2 S+3)$
$L^{\prime}:$ number of lines observed in both directions including the baseline.
$S^{\prime}$ : number of occupied stations
$L$ : total number of lines
$S$ : total number of stations

## Strength of Figure

> In a triangulation network, all angles are observed and a base line while the lengths of other lines are computed based on sine rule.

$$
\frac{A B}{\sin C}=\frac{B C}{\sin A}=\frac{A C}{\sin B}
$$

$$
\therefore B C=\frac{A B \sin A}{\sin C}
$$

$$
\therefore A C=\frac{A B \sin B}{\sin C}
$$

$>$ How much a side length is affected if an angle contain an error of 1 arcsecond?

## Strength of Figure

$>$ How much a side length is affected if an angle contain an error of 1 arcsecond?

Difference $=\log \sin A-\log \sin (A+1$ " $)=2.1$ cotio A

## Strength of Figure - Numerical Exercise

> (1) Determine the best route to calculate the side $C D$ from the known side $A B$ in the shown figure.

$$
L^{\prime}=6, L=6, S=4, \text { and } S^{\prime}=4
$$

$$
C=\left(L^{\prime}-S^{\prime}+1\right)+(L-2 S+3)=(6-4+1)+(6-8+3)=4
$$

$$
D=10
$$

$F=\frac{D-C}{D}=\frac{10-4}{10}=0.60$

## Strength of Figure - Numerical Exercise

| Route No | Triangle | Known Side | Unknown Side | Distance Angle |  | $\left(\delta_{A}^{2}+\delta_{A} \delta_{B}+\delta_{B}^{2}\right)$ | $\sum\left(\delta_{A}^{2}+\delta_{A} \delta_{B}+\delta_{B}^{2}\right)$ | R |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | A | B |  |  |  |
| $\mathrm{R}_{1}$ | ABC | AB | BC | 20 | 30 | 67.505 | 70.49 | 42.29 |
|  | BCD | BC | CD | 60 | 70 | 2.98 |  |  |
| $\mathrm{R}_{2}$ | ABD | AB | BD | 50 | 70 | 5.036 | 10.07 | 6.04 |
|  | BDC | BD | DC | 50 | 70 | 5.036 |  |  |
| $\mathrm{R}_{3}$ | BAC | BA | AC | 20 | 130 | 26.227 | 31.16 | 18.7 |
|  | ACD | AC | CD | 110 | 40 | 4.934 |  |  |
| $\mathrm{R}_{4}$ | BAD | BA | AD | 50 | 60 | 6.711 | 35.31 | 21.18 |
|  | ADC | AD | DC | 30 | 40 | 28.596 |  |  |

Then, the best route to compute side $C D$ from the baseline $A B$ is $\mathbf{R}_{2}$ using the triangles $\mathbf{A B D}$ and $\mathbf{B D C}$.

## Strength of Figure - Numerical Exercise

> (2) Determine the best route to calculate the side ED from the known side AB in the shown figure.
$L^{\prime}=12, L=12, S=7$, and $S^{\prime}=7$
$C=\left(L^{\prime}-S^{\prime}+1\right)+(L-2 S+3)=(12-7+1)+(12-14+3)=7$
$D=22$
$F=\frac{D-C}{D}=\frac{22-7}{22}=0.68$

## Strength of Figure - Numerical Exercise

| Route No | Triangle | Known Side | Unknown Side | Distance Angle |  | $\left(\delta_{A}^{2}+\delta_{A} \delta_{B}+\delta_{B}^{2}\right)$ | $\sum\left(\delta_{A}^{2}+\boldsymbol{\delta}_{A} \delta_{B}+\boldsymbol{\delta}_{B}^{2}\right)$ | R |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | A | B |  |  |  |
| $\mathrm{R}_{1}$ | ABG | AB | BG | 15 | 40 | 87.3 | $326.1 \times 0.68$ | 221.7 |
|  | GBC | BG | GC | 20 | 60 | 41.8 |  |  |
|  | GCD | GC | GD | 40 | 10 | 177.9 |  |  |
|  | GDE | GD | ED | 60 | 30 | 19.1 |  |  |
| $\mathrm{R}_{2}$ | ABG | AB | AG | 15 | 50 | 78.3 | $169.6 \times 0.68$ | 115.3 |
|  | AGF | AG | GF | 20 | 30 | 67.5 |  |  |
|  | GFE | GF | EG | 70 | 80 | 1.0 |  |  |
|  | EGD | EG | ED | 50 | 30 | 22.7 |  |  |

Then, the best route to compute side ED from the baseline AB is $\mathbf{R}_{2}$ using the triangles $\mathrm{ABG}, \mathrm{AGF}, \mathbf{G F E}$, and $\mathbf{E G D}$

## Strength of Figure - Numerical Exercise

> (3) Determine the best route to calculate the side $E D$ from the known side $A B$ in the shown figure.
$L^{\prime}=8, L=8, S=5$, and $S^{\prime}=5$
$C=\left(L^{\prime}-S^{\prime}+1\right)+(L-2 S+3)=(8-5+1)+(8-10$
$+3)=5$
$D=14$

$F=\frac{D-C}{D}=\frac{14-5}{14}=0.64$

## Strength of Figure - Numerical Exercise

| Route No | $\underset{\mathrm{e}}{\text { Triangl }}$ | Known Side | Unknown Side | Distance Angle |  | $\left(\delta_{A}^{2}+\delta_{A} \delta_{B}+\delta_{B}^{2}\right)$ | $\sum\left(\delta_{A}^{2}+\delta_{A} \delta_{B}+\delta_{B}^{2}\right)$ | R |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | A | B |  |  |  |
| $\mathrm{R}_{1}$ | ABC | AB | BC | 40 | 65 | 9.7 | 166.6 | 106.6 |
|  | BCE | BC | EC | 78 | 30 | 15.1 |  |  |
|  | CED | EC | ED | 90 | 10 | 141.85 |  |  |
| $\mathrm{R}_{2}$ | ABC | AB | AC | 40 | 75 | 7.98 | 151.4 | 96.89 |
|  | ACE | AC | EC | 83 | 60 | 1.6 |  |  |
|  | CED | EC | ED | 90 | 10 | 141.85 |  |  |
| $\mathrm{R}_{3}$ | ABE | AB | AE | 10 | 45 | 171.3 | 329.95 | 211.2 |
|  | AEC | AE | EC | 32 | 60 | 16.8 |  |  |
|  | CED | EC | ED | 90 | 10 | 141.8 |  |  |
| $\mathrm{R}_{4}$ | ABE | AB | BE | 10 | 125 | 126.5 | 284.5 | 182.1 |
|  | BEC | BE | EC | 72 | 30 | 16.18 |  |  |
|  | CED | EC | ED | 90 | 10 | 141.85 |  |  |

Then, the best route to compute side ED from the baseline AB is $\mathbf{R}_{2}$ using the triangles $\mathbf{A B C}, \mathrm{ACE}$, and $\mathbf{C E D}$

## (2) Reduction to Center (Satellite Station)

## Satellite Station - Problem Definition

$>$ In a triangulation network, mosques, church spires, or any similar tall objects are marked as triangulation stations.
$>$ Such types of stations cannot be occupied.
> Consequently, the instrument is set up on an auxiliary station which is so close to the main station.
$>$ This auxiliary station is called "Satellite Station"
> At the satellite station, all angles to the adjacent stations are measured with the same precision of other angles in the system.
$>$ The process of computing the main angle at the inaccessible station from the measured ones is called "Reduction to center"

## Satellite Station - Problem Definition

$>$ From the shown figure:
$\boldsymbol{Y}, \boldsymbol{T}$, and $\boldsymbol{B}$ : triangulation stations
$T$ : inaccessible triangulation station
$\boldsymbol{S}$ : satellite station
$\alpha_{1}, \alpha_{2}$ : observed angles
$a$ : distance between satellite station and inaccessible station.
By solving triangles TSB, and TSY

$\frac{\sin c_{1}}{a}=\frac{\sin \alpha_{1}}{d_{1}}$, and $\frac{\sin c_{2}}{a}=\frac{\sin \alpha_{2}}{d_{2}}$
i.e.,
$c_{1}=\sin ^{-1} \frac{\mathrm{a} \times \sin \alpha_{1}}{d_{1} \times \sin 1^{\prime \prime}}$
$c_{2}=\sin ^{-1} \frac{\mathrm{a} \times \sin \alpha_{2}}{d_{2} \times \sin 1^{\prime \prime}}$
Such that $c_{1}$, and $c_{2}$ are given in seconds.

## Satellite Station - Numerical Exercise

(1) Directions were observed from a satellite station $\mathrm{S}, 150 \mathrm{ft}$ apart from the main triangulation station T such that direction $\mathrm{SA}=00^{\circ} 00^{\prime} 00^{\prime \prime}, \mathrm{SB}=71^{\circ} 54^{\prime} 30^{\prime \prime}$, and $\mathrm{ST}=296^{\circ} 12^{\prime} 15^{\prime \prime}$. Compute the subtended angle (ATB) at the main station $T$ if the length of sides $T A=54070 \mathrm{ft}$, and $\mathrm{TB}=71280 \mathrm{ft}$.

$$
\begin{aligned}
& \alpha_{2}=360-296^{\circ} 12^{\prime} 15^{\prime \prime}=63^{\circ} 47^{\prime} 45^{\prime \prime} \\
& \alpha_{1}=\alpha_{2}+\widehat{A S B}=63^{\circ} 47^{\prime} 45^{\prime \prime}+71^{\circ} 54^{\prime} 30^{\prime \prime}=135^{\circ} 42^{\prime} 15^{\prime \prime} \\
& c_{1}=\sin ^{-1} \frac{a \times \sin \alpha_{1}}{d_{1} \times \sin 1^{\prime \prime}}=\sin ^{-1} \frac{150 \times \sin 135^{\circ} 42^{\prime} 15^{\prime \prime}}{71280 \times \sin 1^{\prime \prime}}=303^{\prime \prime} \\
& c_{2}=\sin ^{-1} \frac{a \times \sin \alpha_{2}}{d_{2} \times \sin 1^{\prime \prime}}=\sin ^{-1} \frac{150 \times \sin 63^{\circ} 47^{\prime} 45^{\prime \prime}}{54070 \times \sin 1^{\prime \prime}}=513.41^{\prime \prime} \\
& \theta=\widehat{A T B}=\alpha_{1}^{\prime}-\alpha_{2}^{\prime}=71^{\circ} 50^{\prime} 59.72^{\prime \prime}
\end{aligned}
$$

## Satellite Station - Numerical Exercise

$>$ (2) Instead of a main triangulation station A which is not accessible, a theodolite was setup at station S 10.44 ft apart and approximately south-east from A . The observed direction to A was $43^{\circ} 22^{\prime} 15^{\prime \prime}$ while that to B was $158^{\circ} 48^{\prime} 57^{\prime \prime}$ and that to C was $227^{\circ} 25^{\prime} 41^{\prime \prime}$. The lengths of AB and AC are 16560 ft and 21580 ft , respectively. Compute angle BAC.

$$
\begin{aligned}
& \alpha_{1}=\operatorname{directions}(S B-S A)=115^{\circ} 26^{\prime} 42^{\prime \prime} \\
& \alpha_{2}=360-\operatorname{directions}(S C-S A)=175^{\circ} 56^{\prime} 34^{\prime \prime} \\
& c_{1}=\sin ^{-1} \frac{\mathrm{a} \times \sin \alpha_{1}}{A B \times \sin 1^{\prime \prime}}=\sin ^{-1} \frac{150 \times \sin 135^{\circ} 42^{\prime} 15^{\prime \prime}}{71280 \times \sin 1^{\prime \prime}}=117.42^{\prime \prime} \\
& c_{2}=\sin ^{-1} \frac{\mathrm{a} \mathrm{\times} \mathrm{\sin } \mathrm{\alpha}_{2}}{A C \times \sin 1^{\prime \prime}}=\sin ^{-1} \frac{150 \times \sin 63^{\circ} 47^{\prime} 45^{\prime \prime}}{54070 \times \sin 1^{\prime \prime}}=7^{\prime \prime} \\
& \alpha_{1}^{\prime}=\alpha_{1}+c_{1} \\
& \alpha_{2}^{\prime}=\alpha_{2}+c_{2} \\
& \theta=\widehat{B A C}=360-\left(\alpha_{1}^{\prime}-\alpha_{2}^{\prime}\right)=68^{\circ} 34^{\prime} 39.58^{\prime \prime}
\end{aligned}
$$

## THANK YOU

End of Presentation
